Code Critique

We have decided to choose Code Base Candidate E, for many reasons.
First, it is most similar to our own code in that it has most of the same functionality that we
had by stage one. What we did not like about some of the others is that they went above and
beyond for stage one and we feel like we want to take care of these things our own way. We
also like code that is readable, well commented, and broken up into smaller methods, which
are all characteristic of candidate E. A few less important aspects that we considered were
JUnit tests, which were very complete for candidate E. Although tests are not one of the most
important attributes that we look for, it is reassuring to know that the code we are using has
been thoroughly tested. The wide variety of tests will also be helpful in that if we run into
errors we can run these tests to see what has gone wrong. We decided not to go with D
because it contained some very complex code which we thought would be time inefficient to
try and understand.
